

Cyprus .NET User Group – Event No. 8

February 15th, 2006

Momentum... Something that eventually marks the start of the year, for the third time in a row – a Microsoft organized, all-day, large-scale event hosting multiple tracks, targeting various sectors of an IT industry in Cyprus. Thanks to the CDNUG last-minute participation, the developers' track of the event was successful and there we witnessed a bunch of cool stuff coming to our desktops soon.

One of the sessions presented on the Momentum '06 targeted ASP.NET 2.0 and various new features that shine around it. Having said that, the CDNUG has intentions of bringing more interesting stuff about ASP.NET – just about now. With the much appreciated help of Panayiotis Panayiotou – the CDNUG's regular presenter and contributor, we will dive into more specific problems ASP.NET developers are facing in various projects and what version 2.0 has to offer as a solution to those problems.

Site Navigation Features of ASP.NET 2.0 (by Panayiotis Panayiotou)

Websites frequently need to display navigation data that guides users through a site. Due to lack of time or experience, developers have the tendency to create static and non-maintainable navigation structures. The navigation features of ASP.NET 2.0 allow developers to easily define navigation data and display UI based upon this information. **The Site Navigation API is a provider-based programming abstraction for accessing site navigation data.**

In this session, Panayiotis will cover the basics of how to build navigation structures and render the information as well as to give some useful tips and techniques developers can utilize in their projects.

An event will take place on Wednesday, February 15th at the conference room of Microsoft Cyprus, with start at 19:00. For more information please visit CDNUG website (<http://www.atozed.com/cdnug>).
